An Interactive Competency Approach to Career Exploration and IDP Implementation

José M. Barral^{1,2}, David W. Niesel^{1,2}, M. Kristen Peek^{1,2}, Bret T. Howrey² and Garth A. Fowler³ ¹Graduate School of Biomedical Sciences and ²School of Medicine, The University of Texas Medical Branch, Galveston, TX 77555-1050; ³American Psychological Association, Washington, DC 20002-4242

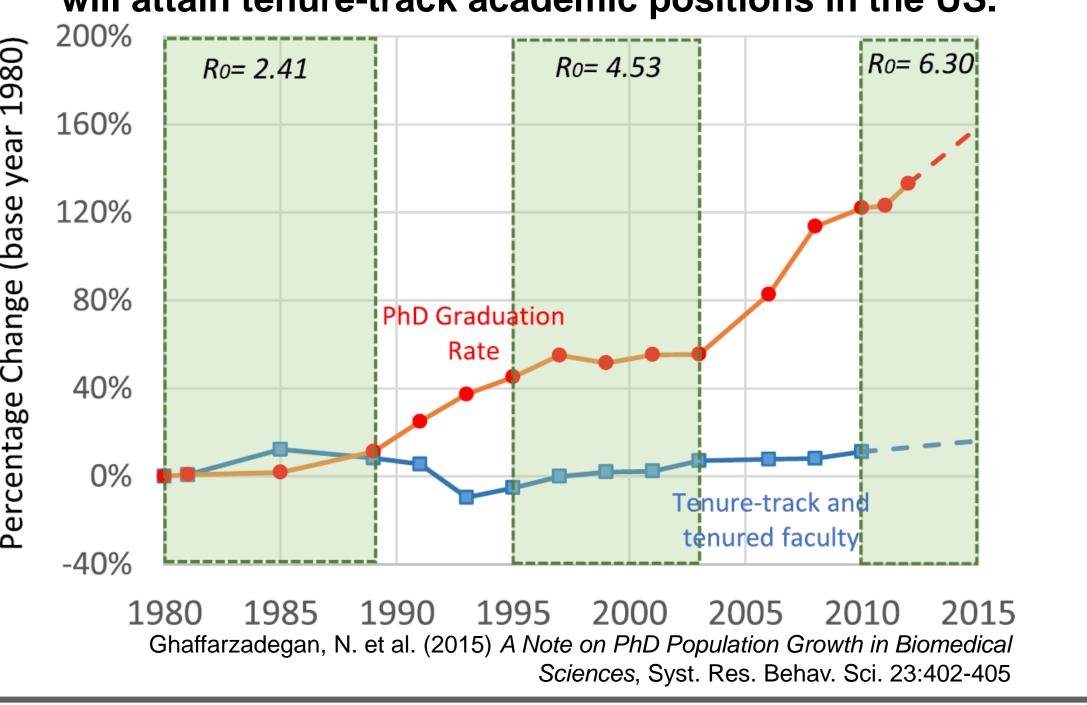

Background

The paucity of academic positions has resulted in increasing numbers of PhD graduates from a wide spectrum of disciplines pursuing careers outside of traditional academia¹⁻³. Scientific and professional societies, academic institutions, advocacy groups and for-profit organizations have designed and implemented robust initiatives to alert and expose PhD trainees to a variety of nonacademic career paths available to them⁴. Many of these efforts have converged on the use of an Individual Development Plan (IDP) as a tool that drives and supports career exploration^{4,5}. In general, IDPs should be reflective instruments that allow students to: assess their abilities, values, interests and personality traits; explore compatible career paths; and set goals to advance their skills and abilities. Implementation of the IDP, with the assistance of mentors, is a part of an iterative 'Career Decision-Making Cycle' through which students improve their skills and refine their selections. Our over-arching goal was to begin to identify and develop the competencies that facilitate finding employment in a fulfilling career.

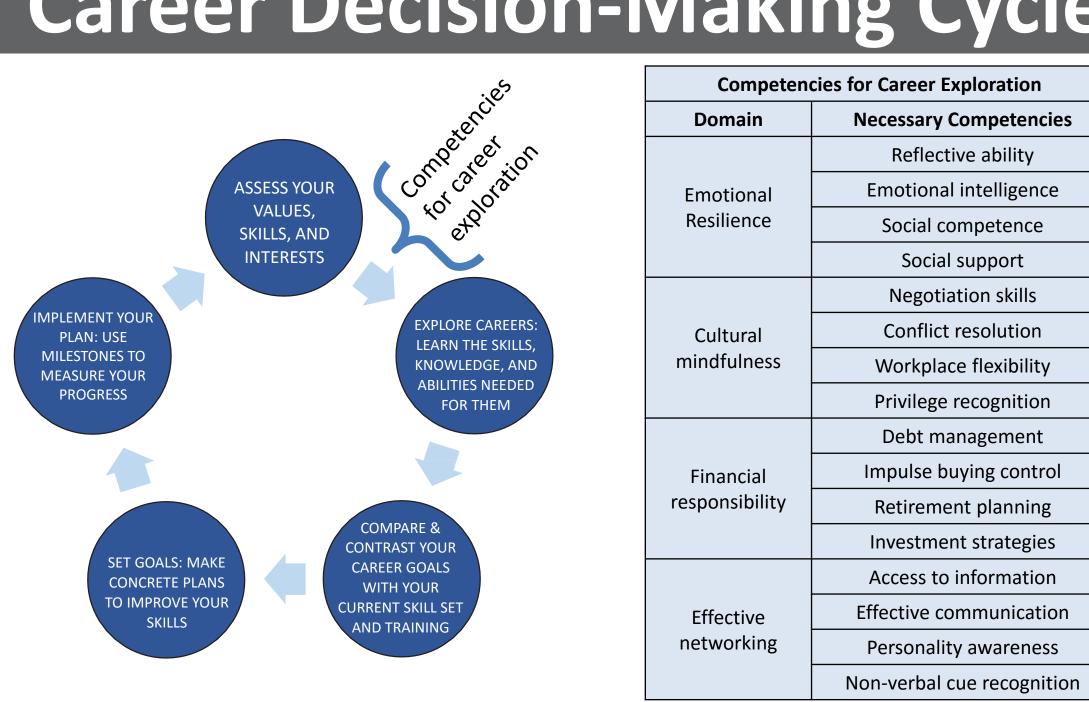

It is estimated that only ~1 in 6.3 Biomedical PhD graduates (~16%) will attain tenure-track academic positions in the US.

Needs Assessment

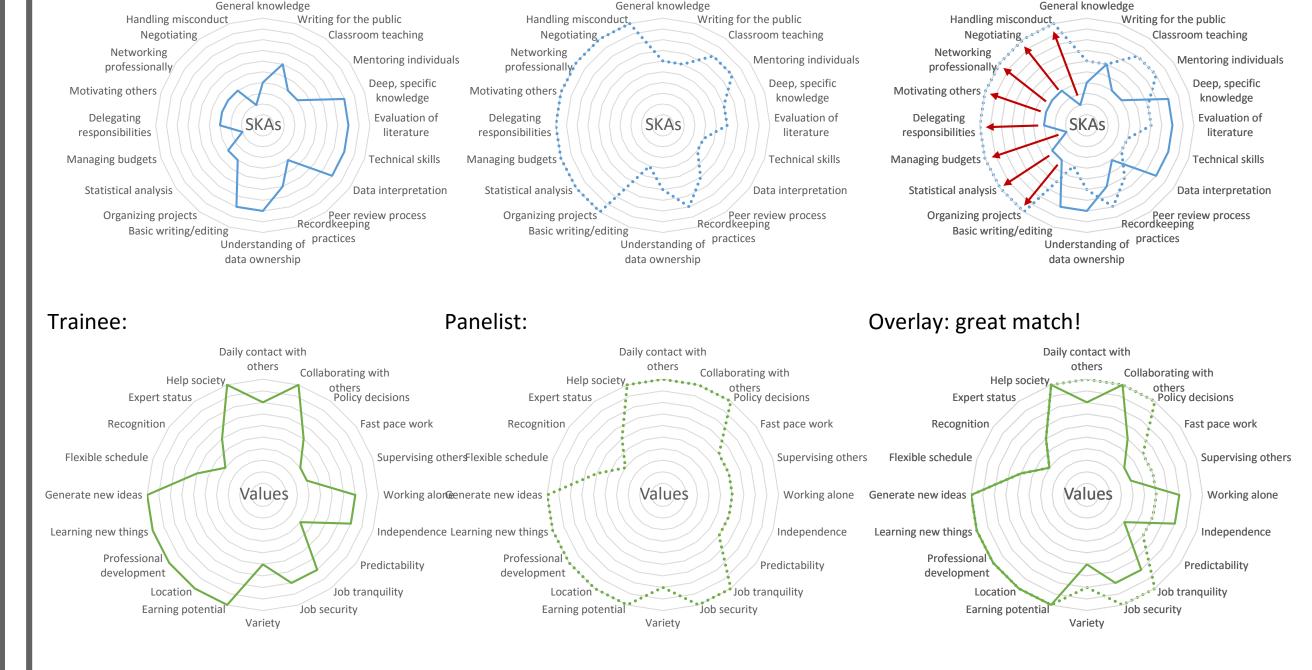

IDPs help trainees focus on skills, knowledge, and abilities (SKAs) needed for career success. They generally consist of iterative cycles of: self-assessment \rightarrow career exploration \rightarrow goal setting \rightarrow plan implementation \rightarrow self-assessment. However, successful career progression requires the development of competencies— the effective use of knowledge, and minimal level of skill performance that results in securing a job, improving abilities, and advancing in a chosen career. In addition, competencies vary among careers: for example a career in science policy requires knowledge integration across multiple fields, while a career in R&D at a biotechnology company requires focused knowledge and highly defined skills. It would be optimal for graduate students and postdoctoral scholars to identify early in their training not just SKAs, but to efficiently utilize IDPs to help them understand the required competencies and to take steps to achieve them.

Career Decision-Making Cycle

Our Approach

We developed a process aimed to promote (a) active reflection of trainees' own current SKAs, interests and values; (b) thorough exploration of potentially compatible current and future career choices; and (c) realistic goal setting. The process culminated in a two-day career forum that incorporated an "element of surprise" to increase trainee engagement

1. Trainees complete online IDP*

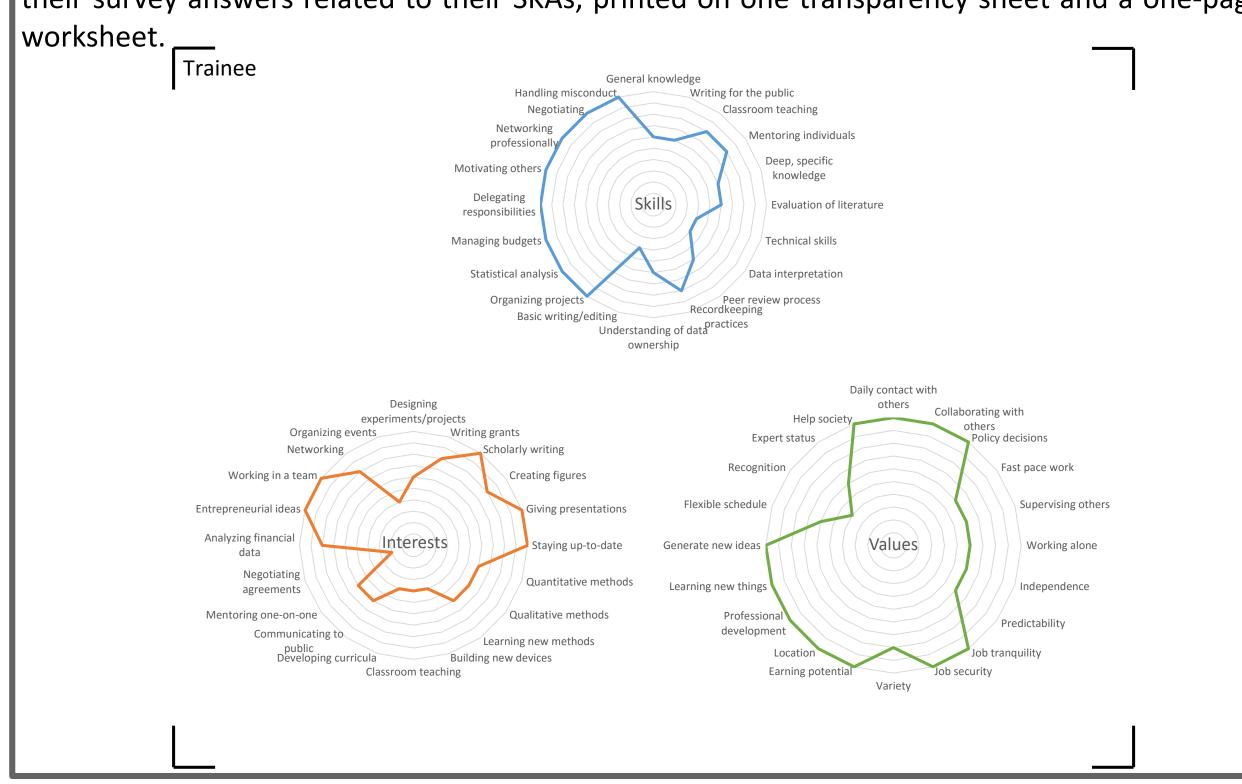

Prior to the career forum, trainees completed an abbreviated online survey to assess their SKAs, interests and values (modified, with permission⁶, from myIDP.sciencecareers.org).

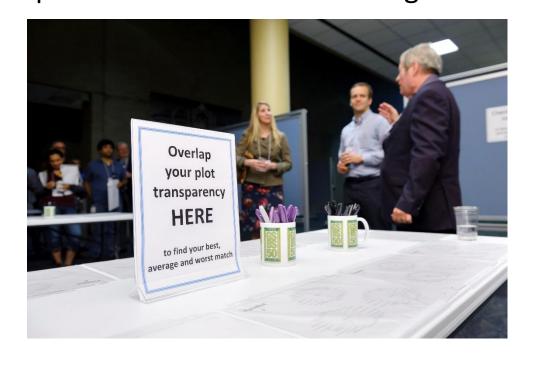

2. Generate SKA Fingerprint

At the beginning of the forum, each trainee received a graphical representation ('radar plots') of their survey answers related to their SKAs, printed on one transparency sheet and a one-page

3. Compare with Panelists' Fingerprints

Trainees compared their SKA fingerprints with those of twelve career forum panelists (established academicians and professionals from diverse fields who completed identical surveys in advance) by physically overlaying their transparencies with those of the panelists. However, the identities of the panelists were blinded during the first forum day.

4. Complete Worksheets

Trainees utilized their worksheets to identify which panelists (identified only by letters A – F) best match their SKAs, interests and values and set realistic goals.

2017 UTMB Career Forum Worksheet

	Best Match	Average Match	Poor Match	
	Enter panelist letter:	Enter panelist letter:	Enter panelist letter:	
Skills	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17,	
	Enter panelist letter:	Enter panelist letter:	Enter panelist letter:	
nterests	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17)	
	Enter panelist letter:	Enter panelist letter:	Enter panelist letter:	
Values	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17)	Job description: (revealed 3/11/17,	

5. Reveal Panelists' Identities

The following day, identities of the panelists were revealed, and trainees attended interactive sessions with them. Trainees utilized their worksheets to set realistic goals and progress measures, based on their interactions with the panelists.

For Profit Arena:

- A. Senior Project Manager, AlliantGroup.
- B. Principal Research Scientist, Eli Lilly & Co.
- C. Account Manager, Bio-Rad Laboratories D. Director of Intellectual Property, Kraton Polymers

Panelists:

- Non-Profit Arena: . Senior Epidemiologist, Centers for Disease Control
- . Program Director and Team Leader, NCI, NIH
- G. Education & Professional Dev. Manager, ASBMB
- H. Editor-in-Chief, American Scientist Magazine **Academic Arena:**
- . Study Director, Regulated Studies, UTMB
- . Health Innovations Director, Digital Health, UTMB K. Assistant VP for Strategic Initiatives, UT Arlington
- . Assistant Professor, McNeese State University

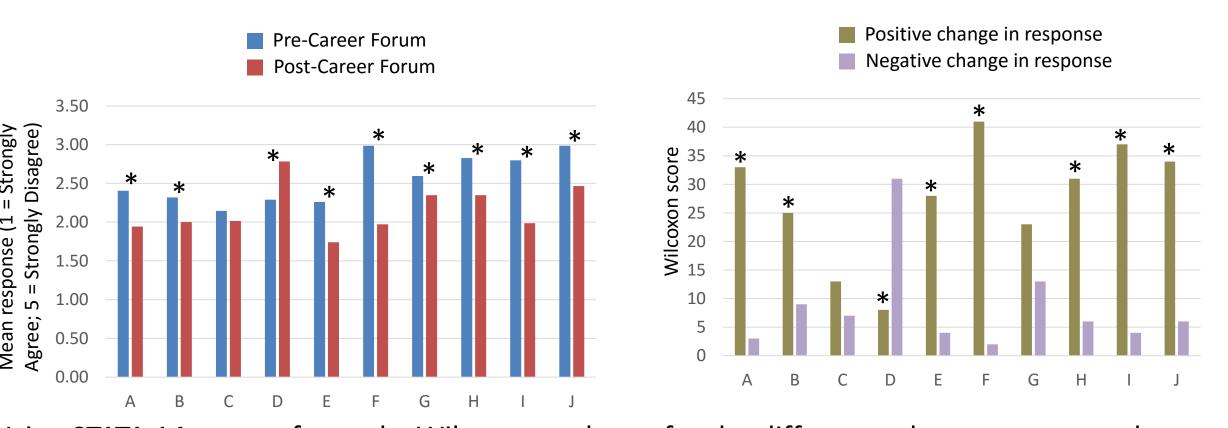

Pre- and Post- Surveys

1 = Strongly Agree; 2 = Agree; 3 = Neutral; 4 = Disagree; 5 = Strongly Disagree

Using STATA 14, we performed a Wilcoxon rank test for the differences between pre- and postcareer forum scores for 69 students who completed both surveys. The right panel shows the positive and negative change in score between pre- and post-career forum. The green bars represent the positive change and are significant for all questions except for two (p < 0.01).

Conclusions and Future Steps

Conclusions:

- Trainees were highly engaged in using our IDP approach to compare their SKAs with those of panelists, which assisted in building competencies for career exploration.
- Overall, our results strongly suggest that this approach had a positive impact on students' attitudes towards their career preparation and decreased their anxiety.
- Particular advantages of our approach to IDP implementation include:
- Iterative cycles of self-assessment
- Visualization of SKAs that permits observation of their evolution over a continuum
- Efficient comparison of SKAs with peers or with professionals in a diverse range of fields
- Design of a "road map" for future career exploration and eventual career satisfaction

Future Steps:

- Identification of "fingerprint SKAs" for different professions or careers, by administering our IDP to a large set of alumni.
- Identification of areas of variation within each career, due to individual approaches and roles.
